Filling out the Checklist

The checklist asks you to describe the proposed project, the project site and surrounding area, and the likely changes to the environment that would result from the project. The information will be used by all agencies that have a permit or approval to issue for your proposal. The questions apply to all parts of your project, even if you plan to do them over a period of time or on different parcels of land.

The following guidance is provided to assist you in completing the checklist. If an agency has revised Part A of the checklist, so that the numbers no longer coincide, the titles provided should assist you in locating the relevant material.

You must answer each question accurately and carefully, to the best of your knowledge. Complete answers to the questions now may avoid unnecessary delays later. Looking over the checklist before you begin will help you know what information is required. Although most questions can be answered with a familiarity of the project, the site, and the surrounding area, some information will have to be obtained from other sources, such as the city or county in which your project will occur. This guide will provide you help in both answering the questions and locating the information you will need.

The information you provide will help the agencies analyze your project and decide whether additional studies (i.e. wetland delineation or traffic study) are needed. This information will also be used by the agencies when deciding whether to issue the necessary permits or approvals—to address the gaps and overlaps between other regulations. The checklist is designed to help you think about the possible environmental consequences of your proposal. You are encouraged to consider ways to eliminate or reduce these impacts through changes in your proposal, restoration efforts, etc.

**TIP**

Required versus “possible” mitigation should be clearly identified in the environmental document. Mitigation that is being considered or possible is appropriate to identify but must be clearly identified as “possible.” Otherwise, any mitigation described is likely to be considered as commitments and conditions of the project.
Guidance for Part A

As noted earlier, the questions in Part A of the environmental checklist may have been reordered or revised from the standard form. In that event, the titles used below may assist you in finding the appropriate guidance, despite a change in numbering. For questions not included here, please contact the agency requesting the checklist for additional guidance.

1. **Project Name**
   Many projects have names but not all. Residential developments, commercial, and industrial ventures are often named. If the project does not have a name, the clearer response is “none” rather than leaving the question blank.

2. **Applicant Name**
   More than one person, company, or agency may be listed here. The project’s sponsor(s) or the landowner(s) are more appropriate responses than the name of hired consultants, contractor’s, architects, etc. who may be handling applications—although including all three is preferable.

3. **Applicant Address and Phone Number**
   Including addresses and phone numbers for everyone listed under #2 is preferable, but at minimum the address and phone number of the preferred contact is required.

4. **Date Checklist Prepared**
   This date may be used to document when responses were given. This could alert persons that conditions may have changed and protect the applicant somewhat from charges of misrepresentation if applicable regulations are revised, the proposal is altered, new information becomes known, or an unexpected or catastrophic event occurs at a later date.

5. **Agency Requesting Checklist**
   If the checklist has not yet been requested, list the agency who you intend to submit the checklist to. For agency proposals, list the agency(ies) that will be lead agency for the action.

6. **Timing or Schedule**
   Include information on when any construction is expected to begin and end, initiation of use or operation, expected end of use, and the timing of closure or reclamation. For relicensing of existing facilities/operations, describe the project’s history of licensing and operation.

   The reference to “phasing” refers to where one portion of a proposal is completed or undergoes review and/or approval prior to later
stages. Although construction projects typically have stages (grade and fill, utility installation, building construction, etc.) you need only identify them as “phases” if seasons will pass between the stages. Examples include: land division, site preparation, road construction, and utility installation done first, with building construction occurring at some later indeterminate time; or the development of a recreational facility (golf course or resort) followed by later phases such as condominiums, single-family subdivisions, or commercial development on the same or nearby tracts.

7. **Future Proposals**
   Known expansions and related proposals that are expected to occur, but have not undergone environmental review, should be identified. It may be possible to incorporate the review of future aspects within the review of the current proposal, saving time and money later. The lead agency makes the determination of what aspects can and should be reviewed at this time.

8. **Environmental Information**
   Include reports, studies, or other environmental documents that have been, are being, or will be prepared that provide relevant environmental information about your project, the site, or the area. They may be created to support your proposal, for a similar or related project, or they may have been developed during planning by the city or county, etc.

   Identify the special reports, studies or plans required by development regulations or submitted with project applications. Examples might be:
   - Wetland Report
   - Traffic Study
   - Geotechnical Study
   - Archaeological Report
   - Stormwater Pollution Prevention Plan (SWPPP)

9. **Pending Approvals**
   Include any permits, funding, or other approvals that have already been applied for that affect the project site but are not part of the current proposal. Examples include a rezone request, water right application, previous proposal of which this is an addition, etc. A list of common permits can be found on the following page.

10. **Permit Information**
    List all approvals or permits from any governmental entity that you know will be needed for your proposal, whether from the agency requesting the checklist or from other governmental entities. Governmental entities include: cities, counties, state agencies, districts, ports, and federal agencies. Include any required certificates or letters of availability for public services or utilities.
If you do not know the permits that might be required, contact the agency requesting this checklist or the Office of Permit Assistance (OPA) [Department of Ecology, Olympia, 360-407-7564, 1-800-917-0043] can help you. OPA can provide applicants and agencies with personal assistance, The Permit Handbook, and an online interactive program “OPAS” that can help you identify permits for your project.

Commonly required permits include, but are not limited to:

**Local City or County Permits**
- Building
- Preliminary/final plat
- Grading
- Water system
- Shoreline
- Right of way
- Utility
- Site plan review
- Septic system
- Floodplain development
- Variance (zoning, shoreline, etc)
- Outdoor burning

**State Issued Permits**
- Dept. of Fish and Wildlife
  - Hydraulic Project Approval
  - Bald Eagle Management
  - Grass Carp
  - Shooting Preserve
- Dept. of Natural Resources
  - Forest Practices
  - Aquatic lease
  - Burning (forest slash)
  - Reclamation
- Dept. of Ecology
  - Water rights
  - Well drilling
  - NPDES
  - Water quality certification
  - Stormwater
  - Underground storage tank certification
  - Dangerous waste
- Air Authority/Dept. of Ecology
  - New source review, for a business or industry
  - Notice of intent, for demolition projects

**Federal Issued Permits:**
- US Army Corp of Engineers
  - Section 10 (navigable waters)
  - Section 404 (fill in waters)
- US Coast Guard
  - Section 9 (Bridges)
- National Marine Fisheries/US Fish and Wildlife
  - Endangered Species Act consultation

11. **Description:** Provide a description of the type of project (e.g. retail, land clearing, commercial timber thinning, warehouse), and the actions which would occur (e.g. grade, fill, clear, construct, operate, close, demolish, mine). Provide sizes and/or quantities, if known (e.g. building square footage; site or lot acreage; cubic yards of excavation, grading or fill; number of parking spaces; length of roads or utility lines; etc.).

**Example:** Clear-cut timber harvest on 3 acres of a 10-acre parcel, estimated 3,000 cu yds of site grading with import of additional 1,200 cu yds of fill material, construct and operate a 30,500 sq ft commercial
multi-tenant facility with a 900 sq ft paved outdoor garden center, lighted and paved parking for 1,500 vehicles, utility installation including 950-ft extension of both sewer and water lines, onsite stormwater retention/detention facility, and landscaping.

12. **Location**
   If multiple addresses and/or parcel numbers apply to the project, you may identify the primary address and parcel number(s) and refer to an attached map or written description that will provide sufficient information for the reviewer to understand the precise location of the project. Including the section, township, and range information is also helpful.

**Guidance for Part B**

1. **Earth**

   a. **General site description**: Describe the basic shape of the land formation on-site, ignoring structures and vegetation, using terms such as those included in the checklist (flat, rolling, hilly, steep slopes, mountainous, etc.).

   b. **Percent slope**: Percent slope is typically measured by professionals with a clinometer. To calculate it by hand: Field measurements or a topographic map must be used to determine the rise and run of the steepest slope on site. [Information on creating homemade tools to measure the rise (height change) and run (distance) can be found on the University of Minnesota Extension Service’s Website](https://www.extension.umn.edu). The rise and run are then used to calculate the percent slope with this formula:

   $$\text{Percent slope} = \left(\frac{\text{Rise}}{\text{Run}}\right) \times 100.$$

   A 45° angle (where rise and run are equal) would therefore result in a 100 % slope. Ranges of slope are also found in the soil survey books from the U.S. Natural Resource Conservation Service (NRCS)—see soil types.

   c. **Soil types**: Information on specific soil types can be obtained from the U.S. Natural Resource Conservation Service soil survey for your site. Soil survey information is available at many city or county departments of community development or university or other libraries. Soil surveys may also be ordered, when copies are available, directly from the NRCS regional office in Spokane at (509) 323-2900 or 323-2981.

   d. **Unstable soils**: As well as steep slopes, signs of unstable soils include evidence of past landslides, mass wasting, erosion (including wind erosion), subsidence, tilting structures, uneven floors, cracked paving, etc. Areas of past fill (landfills, filled
wetlands or tidal areas, reclaimed surface mines, etc.), destabilization from vegetation removal, evidence or knowledge of high groundwater or concentrated stormwater infiltration, etc. are further indicators of potential soil non-stability.

e. **Purpose of fill, excavation, or grading**: Examples include: to bring site level with street, to level lot, to fill low or wet area, to create a pond, etc.

**Type of fill**: Describe the type of materials to be imported to the site, such as large rocks, gravel, sand, clay, top soil, mixed soil and rock, etc.

**Quantity of fill, excavation, or grading**: Quantities of grading, excavation, and/or fill should be given in cubic yards. Professionals may need to be consulted for this information (architect, contractor, etc.).

**Source of fill**: Be sure to include where any fill will be obtained that will be imported from offsite.

f. **Erosion indicators**: Filling, excavation, grading, or removal of vegetation or other stabilizing ground cover (consider demolition of structures), can encourage erosion. Water traveling over or below ground or deflected off smooth or hard surfaces can cause erosion, as well as unprotected soils exposed to wind.

g. **Impervious surfaces**: Include any square foot where rain cannot percolate into the ground such as building footprints, asphalt and concrete areas, covered or capped ground, and lined ditches or ponds.

h. **Erosion control**: Erosion control methods to defray the potential effects of wind, water, and ice on disturbed soils can include:

   - Minimizing removal of vegetation and/or area of disturbance, especially in areas of vulnerability such as steep slopes or where there is already evidence of destabilization, both during construction and operation/use;
   - Planting or maintaining vegetative cover (consider also how the type of vegetation can affect soil stability—considering root structure, evapotranspiration, and diffusion of wind and water energy);
   - Moistening exposed soils or application of stabilizing compounds to reduce wind erosion;
   - Placement of straw, rip rap, or other materials to reduce exposure of disturbed soils to the elements. Consider how
hard armoring (e.g. bulkheads, riprap) versus soft armoring (vegetation) will affect wind and water energy;

- Placement of roads and structures away from areas of unstable soils or geological hazards;
- Managing stormwater after construction is completed. (Will stormwater collected from large areas of impervious surfaces be discharged directly to the ground at focused locations, released slowly in a diffuse manner, retained on site and discharged directly to surface water, or will it be piped off site?) See also information provided under section B.3. Water.

2. Air

a. **Air emission types:** Dust should be considered a potential air emission if upland vegetation will be removed, or if there will be grading, fill, excavation, rock crushing, demolition, etc.

Some types of activities that generate either indoor or outdoor air pollution emissions or the potential to produce an odor nuisance include:

- Abrasive blasting
- Asphalt preparation
- Coffee roasting
- Composting
- Concrete batching
- Dry cleaners
- Fuel dispensing or storage
- Fuel-fired equipment
- Landfill
- Manure application and storage
- Painting of surface coating
- Planting/Anodizing
- Printing
- Rock or material crushing, grinding, or transport
- Soil or groundwater remediation
- Solvent or other volatile liquid use or storage
- Sterilization processes
- Welding
- Wood processing

If the amount of the emission cannot be quantified (such as from agricultural practices, wastewater facilities, or municipal landfills), describe the source(s), including quantities known or assumed. For example: Liquid manure from X dairy cows will be sprayed on X acres during the months May through September, and will be collected on-site in an X-gallon capacity dairy lagoon.

b. **Off-site sources of air emissions and odors:** See Air for sources. Identify any regional air quality limitations (such as an air quality designated non-attainment area). For information of this type, contact your local Air Quality Authority or the Air...
Quality Program staff at the local Dept of Ecology regional office. Areas with existing air quality issues (smoke and other particulate matter, ozone, carbon monoxide, odor, etc.) are more sensitive to impact and may adversely impact some project activities.

c. **Measures to reduce or control air emissions**: Methods that will be used to reduce or eliminate dust or other air emissions include methods to contain, treat, or reduce odors and/or pollutant emissions, such as consistently covering material soon after deposit, placing covers over or aerating wastewater lagoons, use of bag houses or air scrubbers, wetting or otherwise stabilizing disturbed soils, using “clean” fuel/power, recycling solid waste (rather than burning or landfill), etc.

3. **Water**

   **Note**: Washington Dept. of Ecology’s Water Quality Program has information that may be helpful in identifying water quality issues and improving your proposal on their [website](#).

   a. **Surface Water**

      **Water body on or near**: Describe (and name whenever possible) any onsite or nearby surface water body, including streams (permanent, intermittent, or seasonal), rivers, ponds, wetlands, lakes, salt water, etc. (Although a distance has not be set by rule, within 300 feet or the width of the floodplain, whichever is larger, may be a good rule of thumb to use for determining “nearby.”)

      **Work in, on, or near the water**: Include grading, fill, or excavation; installation, construction, or demolition; paving; painting or other maintenance activities; storage of materials; planting or removal of vegetation; etc. if it will occur within 200 feet of the water and describe where these activities will take place in relation to the water body.

      **Water body fill or dredge**: Describe the quantity, type of material, and the location including the size of the area to be filled or dredged. Example: Remove 4,000 cubic yards of silt and gravel from Big River to maintain navigational channel between river mile (RM) 3.5 and RM6.2.

      **Surface water withdrawals and diversions**: Describe quantity and location of any surface water withdrawal even if for a nonconsumptive use (meaning the same quantity of water is returned to the water body). Diversions refer to changes in flow patterns, such as diverting a stream away from a building site or the creation of ponds or inlets.
**Floodplain:** Zone designations are found on the Federal Emergency Management Agency (FEMA) Flood Insurance Rate Maps (FIRMs). FEMA maps are available through the local jurisdiction (city or county) or by contacting Dept. of Ecology's regional floodplain staff.

**Discharge of waste:** Include industrial wastewater; domestic sewerage; agricultural runoff; stormwater drainage from parking lots, equipment storage areas, chemically-treated lawns and landscaping; etc. Describe the source, the likely contaminates, and quantities if known.

b. **Ground Water**

**Ground water withdrawals and discharges:** Describe any new or increased groundwater extractions, including use or purpose and approximate quantities if known. For water discharges to ground, remember to consider how stormwater runoff collected from impervious surfaces is managed onsite.

**Waste discharges to ground:** Septic systems are a primary source of waste discharges to ground, but unlined ponds or trenches used for discharge or storage of liquid waste (liquid manure, food processing waste, contaminated waters, etc.) should also be considered. Remember to include size/quantities and to describe the nature/characteristics of the waste to the degree known.

c. **Water runoff (including stormwater):**

Runoff source and flow: Describe the source of runoff, any intended management systems, and both where and how the runoff will be discharged or allowed to flow to ground or surface waters.

**Waste or contamination of runoff:** In considering whether waste could be carried to ground or surface waters, consider potential sources of contamination (such as parking lots, equipment storage, agricultural practices, lawn and landscaping maintenance, animal waste, treated wood, eroding soils, etc.), any treatment provided, and where the runoff will flow or be discharged. Describe the type/source of potential contamination and the water body or aquifer it is likely to end up in.

d. **Mitigation for water impacts:**

Mitigation measures for water quality impacts may include:

- Erosion control measures (See section B.1.h above);
- Minimizing or avoiding activities within water bodies;
- Working in dry conditions where possible;
- Method choice for dredging;
- Providing adequate buffers;
- Planting and/or maintenance of native vegetation—including trees and shrubs;
- Replacement or compensation for lost functions;
- Avoiding or minimizing contamination of stormwater;
- Adequate treatment and retention of stormwater;
- Maintaining/replacing septic systems or using public sewer systems;
- Limiting use of fertilizers and pesticides;
- Optimum treatment of sanitary and/or industrial wastewater;
- Location or manner of wastewater discharge (diffusion, area of rapid mixing and/or aeration, etc.);
- Recycle or treat and reuse wastewater;
- Using steel or concrete pilings rather than treated wood;
- Plan over-water structures to minimize shading with narrower width or filtering light through glass or grating.

Mitigation measures for flooding may include:
- Minimizing footprint of impervious surfaces,
- Avoiding construction or fill within wetlands and/or floodplains,
- Replacement of lost wetlands,
- Retention of natural vegetation—including trees,
- Vegetation plantings,
- Stormwater management and detention,
- Groundwater recharge versus discharge to surface waters,
- Location and design of wastewater discharge.

Mitigation measures for impacts to water availability to consider:
- Recycle or treat and reuse wastewater,
- Use of equipment or methods to reduce water use,
- Eliminate or minimize existing water consumption,
• Use of alternate source where impact would be reduced.

4. **Plants**

   a. **Types of vegetation**: Information on vegetation types is available from the local Washington Department of Natural Resources, the Puget Sound Environmental Atlas, and/or the city or county.

   b. **Vegetation removal or alteration**: In most cases the amount of vegetation that will be lost or altered is most easily described in land area (acres or square footage). Selective removal or alteration of a relatively small number of individual trees or other plant(s) would be an exception. If harvesting timber, you may wish to include information on board feet as well as the acreage involved.

   d. **Vegetation mitigation**: Avoiding or minimizing disturbance, plantings (particularly of native plant species), removal of invasive species, and reseeding should be considered as ways to mitigate impacts to vegetation. Protection, replacement, or enhancement of rare or valuable habitat is of particular value.

5. **Animals**

   a. **Types of animals**: Information on the types of animals in your area is available from the local Washington Department of Fish and Wildlife office, TRAX system through the regional Washington Department of Natural Resources’ office, the Puget Sound Environmental Atlas, and/or the city or county.

   b. **Threatened and endangered species**: Washington Dept. of Fish and Wildlife maintains a [listing](http://ecos.fws.gov/) or you may contact their GIS section in Olympia. A list of the federally-designated threatened and endangered animal species within Washington State is available at [http://ecos.fws.gov/](http://ecos.fws.gov/) or by contacting the U.S. Fish and Wildlife Service or the National Marine Fisheries Service. Lead agencies may also choose to have applicants complete the “Optional Salmon Checklist” available in several formats.

   c. **Animal migration routes**: Consider birds, fish and other wildlife when identifying migration routes. Examples of areas
that should be identified are areas of rare or unique habitat; wildlife corridors; fish-bearing rivers and streams; and lakes, ponds, and other areas where migrating birds are likely to stop.

d. **Wildlife mitigation**: Examples include:
   - Habitat restoration (native plantings; maintaining water quality and hydrology including temperature, stream flow, etc.; protection from human and domestic animal intrusion or noise, light, and glare; etc.);
   - Measures to preserve or restore fish and wildlife corridors;
   - Monitoring or ongoing stewardship of habitat.

6. **Energy and Natural Resources**

   a. **Types of energy**: If different energy types/sources will be used to address separate uses/needs, identify what type will be used for which use (such as natural gas for heating, cooking, and hot water; electricity for all other household needs).

   b. **Solar power interference**: In essence, this question refers to shading of nearby properties as a result of the proposal. If this may occur, please describe which properties will be affected and the degree this is likely to occur.

   c. **Mitigation** may include:
      - Choosing materials or energy sources that have been recycled or are renewable and plentiful,
      - Measures to reduce consumption,
      - Other measures that will increase availability of the resource now or in the future.

7. **Environmental Health**

   a. **Environmental health hazards**: Describe any existing or suspected contamination at the site. Indicators of possible site contamination include some types of past uses: such as auto repair or wrecking facilities, gasoline dispensing facilities, dry cleaning, municipal dump site, radioactive waste, industrial site, log yard, agricultural uses (fertilizers and/or pesticides), etc.

   Contact the Dept of Ecology’s Toxic Cleanup Program staff in the local regional office or headquarters for additional information or assistance in identifying potential or verified contaminated sites, and the type of contamination likely at a site.
Describe any toxic or hazardous chemicals that might be stored, used, or produced during the project’s development and/or construction, or at any time during the operating life of the project. For example, an auto body shop is likely to use solvents and paints and produce, or generate, used cleaning solvents or paint wastes.

The use, storage, and/or transport of minor quantities of cleaning supplies, such as to maintain an office building or for residential needs may be listed as a class rather than individual products. Substances used in large quantities, such as in industrial or agricultural processes, should be identified by name.

**Emergency services**: Emergency services include police, fire, spill response, ambulance or aid car, etc. Include the need for specialized services and response. For example, certain types of facilities are required to acquaint fire departments with the toxic materials stored or processed on-site and the special firefighting needs of the site.

**Mitigation**: Identify mitigation for existing contamination, if any, and for possible impacts during construction and operation of the project.

For possibly contaminated sites, state whether an environmental site assessment has or will be prepared for the site (e.g. Phase I or II site investigation, remedial investigation/feasibility study, etc.). Briefly summarize any actions being taken for additional study or for development of a cleanup plan for contamination or hazardous waste. Contact Ecology’s toxic Cleanup Program and/or an environmental cleanup contractor for information on appropriate cleanup and/or containment methods. List any remedial investigation/feasibility study, federal record of decision or state cleanup action plan. For the project, list any Spill Prevention, Containment and Control Plan (SPCC) or similar environmental, health, and safety plans.

Summarize any plans to contain or address environmental impacts and potential releases in the event of an upset, scheduled or unscheduled shut down, accident or contingency occurring, or if project construction or operations are temporarily or permanently suspended. Also, for these circumstances explain any plans to bypass normal processes or controls.

Describe any measures during construction and operations to reduce or eliminate the use or production of hazardous substances.
b. **Noise:**

**Noise in area:** Consider noises associated with vehicles, machinery, drilling, blasting, crushing, dropping of heavy objects, sports fields, playgrounds, loud music, animals, bells, sirens, whistles, other alarms, etc.

**Noise from proposal:** Truck traffic should be quantified by number and by size of load; construction noise should be described so that the reviewer can understand whether hammering will be the norm, or heavy machinery will be used; etc.

**Mitigation for noise:** Suggestions include:

- Maintenance or construction of berms and/or vegetated buffers,
- Siting of noise source(s) away from receptors (human and animal),
- Limiting operational hours;
- Design of structures to absorb noise,
- Selection of equipment and/or power source to be used.

8. **Land and Shoreline Use**

a. **Current uses:** Be as specific as possible. The words in the parentheses are examples that give more information than the classifications alone.

- Residential (apartments/condominiums, townhouses/duplexes, single-family homes, group home, etc),
- Commercial (gas station/mini-mart, restaurant, grocery store, strip mall, super mall, etc.),
- Community or public service (school, church, daycare, fire station, etc.),
- Industrial (warehouse, light manufacturing, pulp and paper mill, refinery, etc.),
- Natural resource (forest land, mining, wildlife preserve, etc.),
- Recreational (golf course, country club, resort, park, etc.), or
- Agricultural (orchard, crop farm, cattle ranch, dairy farm, poultry, etc.).
b. **Agriculture uses**: Include the type of crop or animal raised on the site, as well as how long ago the agricultural use occurred.

c. **Structures**: Include size, number, and use.

d. **Demolition**: Structures are not limited to buildings, but can include bridges, cell towers, fuel tanks, pipelines, etc. When describing a structure to be demolished, information on size is beneficial.

e. **Zoning**: Include the allowable density as well as the classification. Contact the city or county that has prime jurisdiction over the site for this information.

f. **Comprehensive plan designation**: Contact the city or county that has prime jurisdiction over the site for this information.

g. **Shoreline master program designation**: If the site includes or lies within 200 feet of a shoreline of the state, provide the shoreline designation (contact the city or county for this information).

h. **Environmentally sensitive area**: Also referred to as “critical areas,” these are formally identified in an ordinance adopted by cities and counties. Categories include wetlands, streams and surface water bodies, aquifer recharge areas, frequently flooded areas, geologic hazards, and fish and wildlife habitat conservation areas. It is the ordinance of the city or county where the project is located which applies regardless of whether a permit is needed from that city or county.

i. **Persons living or working onsite**: Unless residential occupancy is known (such as in nursing homes, correctional facilities, etc.) the following occupancy rates may be used to calculate the number of people expected to reside within the following types of housing:
   - 2.8 persons per single family residence;
   - 1.9 per unit in multi-unit housing; and
   - 2.4 persons per mobile home.

j. **People displaced by proposal**: Describe the current use made of the site as well as the number of persons displaced. Include both the people that use the site formally (reside, work, etc.) and informally (recreation, transportation, etc.).

k. **Mitigation of displacement**: Describe any measures proposed to reduce or compensate for the displacement of persons
described under question B.8.j.

I. **Consistency with plans and land use designations:**
Describe, if known, how the project complies with existing land use plans and designations or what changes to such will be required. Beyond those named in section 8 in the checklist, the following are examples of plans and designations that the proponent and agencies may also wish to consider:

- Local subarea plan or overlay zones
- State designated harbor
- Air quality non-attainment area
- State salmon recovery plans
- State wildlife plans
- Watershed management plan
- Habitat conservation plan
- Wild and Scenic River designation
- State or national park, monument, wilderness, wildlife refuge, marine sanctuary, scenic area

9. **Housing**

a. **Number of units and income level rating:** Number of units refers to the number of apartments or condominiums rather than buildings in multi-residential developments. Set dollar amounts for rating low, middle, and high income housing isn’t possible here due to inflation factors and variability throughout the state. Information from Washington State’s Office of Financial Management provides information on their website ([http://www.ofm.wa.gov/](http://www.ofm.wa.gov/)) regarding housing costs and income levels throughout Washington State, derived from the US census.

b. **Residential units eliminated:** See guidance under 9.a above.

c. **Housing mitigation:** Consider providing some lower income housing within a development.

10. **Aesthetics**

a. **Building height and exteriors:** Although antennas are excluded, other appurtenances should be measured in stating building height, such as smoke stacks, chimneys, vents, etc. Consider window area in determining the primary building
exterior material.

b. **Views**: Include both scenic and non-scenic views that will change. Answer “none” if the appearance of the site will remain unchanged.

c. **Mitigation for aesthetics**: Views valued by persons recreating, traveling, working and/or living in the area should be considered in the design and review of the project. Mitigation may include:
   - Maintenance or construction of berms and/or vegetated buffers,
   - Design of structures,
   - Minimize view obstructions,
   - Maintain the character of the area.

11. **Light and Glare**

   a. **Types of light and glare**: Consider indoor lighting that may be seen through windows, as well as outdoor lighting such as street lights, signage, parking lots, etc. For glare, consider mirrored and unmirrored glass, and unpainted metal surfaces.

   b. **Safety and views**: Consider potential safety impacts to motorists, boaters, air traffic, and pedestrians on and offsite; as well as safety and/or view impacts to nearby residents, area workers, tourists, wildlife and domestic animals.

   c. **Off-site sources of light and glare**: Consider how light and glare from off-site sources could affect residents or workers during construction or operation of the proposed project. Effects on native or domestic animals also need to be considered.

   d. **Mitigation for light and glare**: Mitigation may include:
      - Maintenance or construction of berms and/or vegetated buffers;
      - Limiting hours of operation or construction work;
      - Design or placement of structures to minimize light and glare or view obstructions.

12. **Recreation**

   a. **Recreational opportunities**: Be as specific as possible. Examples include:
      - Walking, hiking, biking, picnicking
Dirt biking, dune buggies, horseback riding
Play ground, ball field, tennis or basketball courts, golf course
Water park, swimming area or pool, boating, rafting, fishing, beach combing
Amusement park, coliseum, stadium, museum, aquarium, zoo, or other public viewing opportunities
Fair, rodeo, or other public celebration event

b. **Displaced recreational uses**: See information provided under B.12.a. above.

c. **Recreational mitigation**: Creation of new or improved recreational opportunities such as an onsite playground and club house, donation of land for park facility, providing public access to beach, etc.

13. **Historic and Cultural Preservation**

a. **Historic register**: Identify whether places or objects on or adjacent to the project site are listed or proposed for listing on a historic register. Contact the local jurisdiction or the State Office for Archaeological and Historic Preservation for information.

b. **Cultural site**: Identify if there are any places or objects on or adjacent to the project site that are of archeological, scientific or cultural importance. Contact the local jurisdiction, the State Office for Archaeological and Historic Preservation, the TRAX system (regional Department of Natural Resources’ offices), or tribal sources for information.

c. **Mitigation for historic or cultural resource**: Suggestions include:
   - Avoidance,
   - Maintaining, or restoring the integrity of the site or landmark to the extent possible,
   - Relocating the structure or artifact,
   - Meeting tribal needs for the sanctity of the location.

14. **Transportation**

a. **Public streets and highways**: Highways or other major arterials listed need not directly access the site but are the major roads likely to be used by employees or residents and for
the transport of materials or goods on or off the project site.

b. **Public transit**: Include details as to the type (bus, subway, train, etc.) as well as the distance to the nearest stop or terminal.

c. **Parking spaces**: If parking spaces are intended for other types of vehicles than automobiles, please state the number of each type. Also be sure to note when answering this question when the spaces are being added and when they are being eliminated.

d. **New roads and street improvements**: It would be beneficial to show any new roadways on a map and describe them here (number of lanes, turn lanes, surfacing, etc.), as well as any appurtenances such as lighting, stormwater conveyance, barriers, signage, etc.

e. **Water, rail, air transportation**: Consider increased demand for the transport of raw materials, products, employees, residents, etc.

f. **Trips per day**: Trips per day is the measure of vehicle trips to or from the project site during a given 24-hour weekday. Many agencies also require information on peak hour trips and it may speed review of your project to include that information on the checklist as well. Only traffic generated by the project need be included. The availability of public transportation, encouragement of car or van pooling, the use of flex-shifts or telecommuting, as well as other traffic mitigation measures may be used to decrease the estimates of traffic generated by the project, but should be detailed in your answer to question 14.g. below.

g. **Transportation mitigation**: Suggestions may include:
   - Providing additional parking,
   - Road improvements (road widening, added signs or signalization, turn-lanes, etc.)
   - A transportation plan for reducing commute trips per day—particularly during peak hours.

15. **Public Services**

   a. **Public service demand**: In describing increased service demand, include the type of service as well as the reason for increased demand.

   b. **Mitigation** may include:
- Donation of property (on or off-site) for public uses,
- Providing recreational facilities,
- Providing on-site security or other emergency services,
- Operational or design measures to reduce emergency risks,
- Impact fees.

16. **Utilities**

a. **Utilities**: Include those utilities that have distribution lines to the site, but note which services will require installation of connection lines to serve the proposal under 16.b, below.

b. **Utility needs**: Identify utilities that will be used for the project, the name of the service provider, and describe any construction required for access. Example: “Natural gas from Johnson Gas Co. with installation of a distribution line from Missouri St and 123rd Ave north to extension of Newton St and from Newton St to each lot.”

SEPA Review Process

1. You contact an agency to apply for a permit, license, or approval for a project.
2. The agency determines if your project must go through SEPA.
   - No: End of SEPA process, permit review continues.
   - Yes: You complete an environmental checklist and may modify your project to reduce impacts.
3. Lead agency reviews checklist and identifies adverse environmental impacts and potential mitigation.
4. Lead agency determines if your project has any remaining probable significant adverse environmental impacts.
   - Yes: Agency issues a determination of significance (DOS) and establishes an environmental impact statement (EIS) for public review and comment. Agency issues a draft EIS for review and comment.
   - No: Agency issues a determination of non-significance (DNS) that may have a comment period.
5. If the DNS has a comment period, the agency considers comments. Agency retains, modifies, or withdraws DNS.
6. SEPA Review Process complete. Agencies can make permit decisions.
